

AMENDMENTS TO THE CLAIMS

Please rewrite Claims 1 and 4 - 7 as follows. A complete copy of the claims is presented, in accordance with the procedure set forth in the Notice referenced above.

B2 Sub C1
1. (currently amended) An inflatable support for providing pressure relief, the inflatable support comprising at least one inflatable transverse cell extending transversely of the support, each at least one transverse cell having outermost opposite ends and within each said outermost opposite end at least one internal cell, each at least one internal cell at a higher pressure than the transverse cell, ~~the internal cell~~ and having a lower height than the transverse cell, such that the whole of ~~the support~~ an upper surface of the transverse cell provides pressure relief.

2. (previously amended) The inflatable support of claim 1, comprising a plurality of transverse cells, inflated and deflated alternately.

3. (previously amended) The inflatable support of claim 1, wherein the at least one internal cell is constantly inflated.

Sub C1
4. (currently amended) The inflatable support of claim 1, wherein the at least one internal cell is chamfered at its at least one internal edges.

B3
5. (currently amended) ~~The~~ An inflatable support of claim 1, ~~wherein comprising~~ at least one inflatable transverse cell extending transversely of the support, the at least one transverse cell having outermost opposite ends and within each said outermost opposite end at least one internal cell at a higher pressure than the transverse cell, the at least one internal cell is having a lower height than the

transverse cell and filled with foam material.

Sub C1
B3
6. (currently amended) ~~An~~ The inflatable support of claim 1, comprising at least one inflatable transverse cell extending transversely of the support, the at least one transverse cell having outermost opposite ends and within each said outermost opposite end at least one internal cell at a higher pressure than the transverse cell, the least one internal cell at each opposite end of the transverse cell having a lower height than the transverse cell and connected by a common manifold and inflated jointly by that manifold.

7. (currently amended) ~~An~~ The inflatable support of claim 6 comprising at least one inflatable transverse cell extending transversely of the support, the at least one transverse cell having outermost opposite ends and within each said outermost opposite end at least one internal cell at a higher pressure than the transverse cell, the least one internal cell at each opposite end of the transverse cell having a lower height than the transverse cell and connected by a common manifold and inflated jointly by that manifold, wherein the manifold is of foam.
